

#WeCount Report April 2022 to June 2023 Released October 24, 2023

Note: This is the fourth in a series of reports. Please check back at <u>www.SocietyFP.org/WeCount</u> for past and future reports. Cite this report using the following DOI: <u>https://doi.org/10.46621/218569qkgmbl</u>.

Introduction

#WeCount is a national abortion reporting effort that aims to capture the shifts in abortion access by state following the June 24, 2022 Dobbs v Jackson's Women's Health Organization Supreme Court decision. The Dobbs decision overturned Roe v Wade, removing the federal protection that Roe had provided since 1973, which permitted abortion in all US states until fetal viability. In the wake of the Dobbs decision, many states have implemented total abortion bans and/or other extreme restrictions on abortion care, with restrictions that carry civil and criminal penalties for those who facilitate abortion. In some states, new abortion restrictions have been litigated in court, resulting in week-by-week changes to the legal status of abortion, creating confusion and abortion care churn. In other states, the enforceability of pre-Roe abortion restrictions remains unclear, and some abortion providers suspended care due to fear of criminal persecution either temporarily or permanently. At the same time, some states have passed protective legislation that has potentially increased access – for residents and people coming from ban states - and protected providers. Given the shifts in where people obtain abortion care in the year following the decision, this national reporting study measures abortions obtained within the formal healthcare system in each state.

#WeCount previously reported on the number of abortions from April 2022 to March 2023, per month, nationally and by state, and restrictiveness level. This report documents the number of abortions from April 2022 to June 2023, representing one full year of abortion delivery post-*Dobbs*. Due to ongoing recruitment and enrollment of providers, we now have more complete data, meaning that numbers in some states for April through March have been revised from our previous reports. Additionally, we have refined our methods for imputation and our pre-*Dobbs* data for comparisons (see Methods). The data include clinician-provided abortions, defined in this report as medication or procedural abortions completed by a licensed clinician in a clinic, private medical office, hospital, or virtual-only clinics (ie, clinics that only provide telehealth abortions) in the US known to offer abortion care during the period of study. This report

does not reflect any self-managed abortions, defined as any attempt to end a pregnancy outside the formal healthcare system, including using medications, herbs or something else, or obtaining pills from friends or online without clinical assistance. However, this report does include telehealth abortions provided by virtual-only clinics in states where it is permitted by law. These data reflect the changing circumstances of abortion provision in the US and can be used by healthcare systems, public health practitioners, and policy makers so that their decisions can be informed by evidence.

National findings

To understand the effects of the *Dobbs* decision on abortion access in states across the country, we compared abortion volume data from April and May 2022, as our pre-*Dobbs* period, to data from July 2022 through June 2023 as our post-*Dobbs* period. Across the US, we found:

- In the year since the *Dobbs* decision, compared to the average monthly number of abortions observed in the pre-*Dobbs* period of April and May 2022, there were 2,200 cumulative more abortions during the 12 months July 2022 to June 2023 (Table 2).
- In the two months before *Dobbs*, the average monthly number of abortions provided by clinicians in the US was 82,115 while in the 12 months after *Dobbs*, the average monthly number of abortions was 82,298 (Table 2).
- The greatest increases in the monthly average number of abortions occurred in March 2023 with 10,565 more abortions than the pre-*Dobbs* period (Table 3).
- The increases in many states mask drastic declines in states with bans.
- The number of abortions nationally has varied month-to-month, with the greatest decline in November 2022 with 8,185 fewer abortions (Table 3).
- Abortion had been increasing in the US since 2017, and abortion rates continued to increase up to the *Dobbs* decision. Thus, the drops in states that lost access in the US after *Dobbs* are even more striking given that need for abortion appeared to be increasing.
- States that experienced declines in the number of abortions after *Dobbs* were also the states with the most restrictions pre-*Dobbs*. Thus, the number of abortions in the months leading up to *Dobbs* likely underrepresent the true need for abortion care.
- Abortions provided by virtual-only clinics continue to increase in the post-Dobbs period, increasing from a monthly average of 4,045 abortions before the Dobbs decision (nearly 5% of all abortions), to an average of 6,950 abortions per month in the 12 months following the Dobbs decision (greater than 8% of all abortions). This change represents an increase of 72% in the number of abortions provided from virtual-only services, comparing post to pre-Dobbs (Table 4).

State restrictiveness findings

The impact of *Dobbs* has differed by state abortion policies. Some of these differences are reported below and shown in the Tables. Legal status is time-varying, and in this analysis, we use the status for each state as reported by the <u>New York Times</u> on the 15th of each month.

The number of states where abortion has been completely banned increased from 9 states in July 2022 to 14 in June 2023. States where abortion was banned in July 2022 included Alabama, Arkansas, Mississippi, Missouri, Oklahoma, South Dakota, Texas, West Virginia, and Wisconsin. Kentucky and Louisiana banned abortion in August and Idaho and Tennessee did so in September 2022. North Dakota banned abortion in April 2023.

- States with abortion bans experienced the greatest reductions in numbers of abortions. In states with total abortion bans, cumulatively there have been 94,930 fewer clinician-provided abortions in the year since *Dobbs* (Table 2).
- This change represents a decrease of 100% in the number of abortions, comparing pre-*Dobbs* 2022 and June 2023.

Ohio and South Carolina had six-week bans in place for the first two months after the *Dobbs* decision and Georgia had a six-week ban beginning in August 2022, which was still in effect as of June 2023.

- States where abortion with six-week abortion bans were in effect saw a cumulative total of 19,660 fewer abortions provided by a clinician (Table 2).
- During the 12 months after the Court's decision, states where abortion was banned or limited to six weeks had 114,590 fewer abortions than would have been expected based on pre-*Dobbs* numbers.

In July 2022, abortion was legal beyond six weeks in 39 states and Washington DC, but this number dropped down to 35 by June 2023.

- The estimated monthly number of abortions provided by a clinician in states and in months where abortion was legal with few restrictions *increased* from 69,940 abortions pre-*Dobbs* 2022 to a monthly average of 79,673 abortions post-*Dobbs* (Table 2).
- States where abortion remained legal saw an average of 9,733 more abortions per month and a cumulative total of 116,790 more abortions in those states in the 12 months post *Dobbs* than would have been expected (Table 2).

Notable state-level findings

The impact of *Dobbs* differs by state. Some of these changes are reported below and all state-level data are shown in Tables 1-4.

States with the largest cumulative increases in the total number of abortions provided by a clinician during the 12-month period after *Dobbs*, referred to in this report as "surge states," include Illinois (21,500), Florida (20,460), North Carolina (11,830), California (8,810) New Mexico (8,640). The increases vary by month in each state.

Many states where abortion remains legal with few restrictions, especially in the Northeast and Northwest, and especially when not bordering restrictive states, did not experience surges in abortions. We observed greater increases in states close to states with bans, even if those receiving states had abortion restrictions such as mandated inperson counseling and waiting periods.

Several states in the Southeast, including Florida, North Carolina, and Virginia continued to see surges in patients. These states have served as important access points for those who have the ability to travel to facilities to obtain care.

States with the largest declines in the number of abortions during the 12-month period after the *Dobbs* decision compared to baseline include Texas (36,970), Georgia (19,660), Tennessee (13,930), Louisiana (9,110), Alabama (7,620), Wisconsin (7,260). A total of 14 states experienced a 100% decrease during the study period.

The declines in Texas are underestimated given that in April and May 2022, a six-week ban was already in effect. If Texas did not have a ban in place and pre-*Dobbs* numbers for April and May were similar to those months in 2021 (average monthly number of abortions= 5,180), cumulatively Texas saw 62,200 fewer abortions in the 12-month period. Declines seen in Oklahoma are also underestimated given that several of the facilities there stopped providing abortions in April 2022 and then a total abortion ban went into effect in May 2022.

Methods

We developed a database of all clinics, private medical offices, hospitals, and virtual clinic providers in the US known to offer abortion care in early 2022, adding new providers as we became aware of them. We started with the Abortion Facility Database from Advancing New Standards in Reproductive Health (ANSIRH) at University of California, San Francisco. We then identified providers who were known to be participating in the Ryan Training program and the Complex Family Planning Fellowship, as well as others identified through outreach from Abortion Finder, the Society of Family Planning, and the Society for Maternal-Fetal Medicine. We then contacted all identified providers in Spring 2022, inviting them to report the monthly number of abortions, starting in April 2022. For this report, we asked providers to share monthly abortion counts for April 2022-June 2023. We continue to recruit abortion providers throughout the study period, incorporating their numbers into each data release. The Society provided compensation to participating facilities for each monthly

submission. Ultimately, 83% of all providers known to #WeCount agreed to participate in this effort.

In this report, we updated some state-level abortion counts, reflecting both revised data submitted by clinics, and newly reported data, previously imputed, from providers that have since joined #WeCount. We describe our imputation strategy below.

We had 100% participation from all clinics in 26 states. For this report, we refined our approach to imputation for missing data in several ways. We developed state-level imputations to account for known clinics that did not participate at all in the remaining states. For 14 states and Washington DC, we estimated the number of missing abortions by state using several information sources, including state health department data, news articles, contacts known to the missing clinics, and knowledge of the abortion volumes by state. The Guttmacher Institute also shared state-level information from the 2020 Abortion Provider Census on missing abortion volume.

For an additional ten states, we estimated the number of abortions provided by hospitals or primary care providers known to provide a small number of abortions but provided no data to #WeCount. Using data reported to #WeCount, we computed the mean number of abortions per month provided by similar hospitals and primary care providers nationally that reported low volumes in April and May 2022. We used this mean to impute April and May 2022 for hospitals and primary care providers that provided no data to #WeCount. We then calculated the average percent change in abortion volume in the state, and imputed values for these low volume clinics for the rest of the study period.

Additionally, we also developed clinic-level imputations for clinics that did not submit a full 15 months of data. For these we calculated average percent change in abortion volume in the state, and imputed values for clinics with missing months.

In total, we received reports representing 82% of all abortions provided by clinicians in the US, while the remaining 18% of the data was imputed. The magnitude of imputation (including state-level imputation, low volume clinic imputation, and clinic-level imputation) is noted with symbols in the data tables.

We estimated numbers of abortions by state restrictiveness level using three categories: states that banned abortion; states that restricted abortion to six-weeks of gestation; and states that permitted abortion. These categories were based on restrictiveness level in each state on the 15th of each month as reported by the New York Times.

This research was deemed exempt by Advarra IRB. All major decisions were guided by a Research Steering Committee <u>listed here</u>. This research was sponsored by the Society of Family Planning.

Table 1 presents the total number of abortions per month by state, for the US, and by restrictiveness category for April 2022 to June 2023. Monthly state totals were rounded to the nearest 10. If the number of abortions for a given state was 0 to 9 for a single month, it was either rounded up to 10, or represented as <10 in the table. Thus, any cell <10 could represent 0 abortions provided. Telehealth abortions provided by virtual-only clinics were counted as part of the abortion total for the state to where the medications were mailed.

Table 2 presents the average number of monthly abortions in the pre-*Dobbs* period (the average of April and May 2022) and in the post-*Dobbs* period (the average of July 2022-June 2023), by state, for the US, and by restrictiveness category. We also present the cumulative sum of all monthly differences in abortion volume from the post-*Dobbs* period (July 2022-June 2023) to the pre-*Dobbs* period (the average of April 2022 and May 2022), and the average monthly difference between the two periods. Note that we have changed our methodology for this table; in previous reports we made comparisons to April 2022. However, given month-to-month variation in volume, in this report we use the average of April and May 2022 to represent the pre-*Dobbs* period for greater stability.

Table 3 presents the monthly difference in abortion volume comparing each month (July 2022-June 2023) to the pre-*Dobbs* period (the average of April 2022 and May 2022), by state, for the US, and by restrictiveness category.

Finally, Table 4 presents the total number of abortions provided by virtual-only clinics per month by state, for the US, and by restrictiveness category for April 2022 to June 2023.

Implications

Trends in the 12 months after Dobbs

Compared to the pre-*Dobbs* months, the monthly average number of abortions in the 12 months post *Dobbs* was, on the one hand, much lower in states that banned abortion, on the other hand, much higher in states that did not ban abortion, than would have been expected if pre-*Dobbs* rates of abortion had remained consistent. Nationally on average, there were 82,115 abortions per month in the two months prior to *Dobbs* period, compared to 82,298 in the post-*Dobbs* period. (Table 2)

Over the study period we observed large fluctuations by month. In May and June, after the leaked draft opinion by Justice Alito, we saw an increase in numbers of abortions in many states, perhaps representing clinics scaling up in anticipation of changes with the *Dobbs* decision. In July, the first full month after the *Dobbs* decision, we saw major declines in states with bans, meaningful declines in states with restrictions, and small increases in states with few legal restrictions. The national number of abortions decreased throughout the second half of the year reaching the lowest point of the 12month period in November (Table 3). Based on prior research, we expect to see seasonality,¹ or natural month-to-month fluctuation in the number of abortions, given variation in pregnancy by month.

Despite 94,930 fewer abortions in states that banned abortion, nationally we saw an increase of 183 average monthly abortions. Several possible explanations may account for this observed increase. Abortion-providing facilities have increased efforts to see patients quickly, particularly in states with early gestational limits. Many facilities in states where abortion is permitted have expanded their capacity and new clinics have opened in surge states, including in Illinois, Kansas, and New Mexico. Many facilities have added capacity for telehealth services, and new virtual clinics, which offer only telehealth care at substantially lower price points have opened in these states. Additionally, several states have passed laws to expand abortion access and protect providers; such laws have likely led to increases among both residents and people traveling from states with bans. Such laws include funding to cover abortion care for out-of-state residents, and policies that mandate insurance coverage of abortion. Given increases in states that are close to states with bans, abortion seekers very likely traveled to nearby states for care.

While it is beyond the scope of these data to test hypotheses about the observed increases in abortion volume in some states, we present some additional possible explanations here. Increased donor funding may have assisted patients who need to travel for care but could not afford to.^{2–4} Clinics and practical support groups became more established in assisting with travel. Access may have been improved via more information on-line about appointment availability. Finally, community mobilization around abortion access may have led to a reduction in abortion-related stigma, impacting people's abortion decision making. In other words, some people with unmet need for abortion, who would have been unable to overcome structural barriers before *Dobbs,* may now be able to get abortion care. Changes in the abortion ecosystem may be helping to mitigate losses to abortion access after the *Dobbs* decision, all against the backdrop of pre-existing monthly fluctuations in the number of abortions.

In April and May, before *Dobbs*, the average monthly number of abortions (82,115) was higher than previous years. The Guttmacher Institute's abortion provider census reported a monthly average of 77,521 in 2020.⁵ The increase observed in April and May 2022 is consistent with an ongoing upward trend in abortion incidence since 2017.⁵ Additionally, the increase in demand for abortion is supported by research in the US that suggests increasing desire to avoid pregnancy and declining birth rates; an increase in abortion incidence may be explained by economic forces and the COVID-19 pandemic.^{6,7} Thus, the loss of abortion access in 14 states in the US after *Dobbs* is even more striking given that there were trends of increasing abortion utilization just before *Dobbs*.

In the 12 months after *Dobbs*, an estimated 94,930 fewer abortions were provided in states that had banned abortion. This translates to, in the 12 months following the *Dobbs* decision, an average of 7,911 fewer clinician-provided abortions per month who were able to obtain abortions in states with bans, as compared to pre-*Dobbs*. People in states with abortion bans were forced to delay their abortion, to travel to another state, to self-manage their abortion, or to continue a pregnancy they did not want.

In states where abortion was already severely restricted before the *Dobbs* decision, such as Missouri, post-*Dobbs* declines appear to be small, because few abortions were occurring in those states before the decision. Similarly, in April 2022, the national number of abortions was already reduced because Texas already had a six-week ban in place for a year, resulting in an underestimate of the true declines seen in that state. Research shows this ban in Texas reduced the monthly number of abortions in Texas by about 2,070.⁸

Data limitations

Measuring abortion access and use is fraught with challenges.⁹ We are unable to estimate the number of abortions that occurred outside the formal healthcare system, such as via Aid Access or volunteer accompaniment networks in Mexico. Separate research estimates the number of requests to Aid Access for abortion medications were about 6,500 per month in the months following the *Dobbs* decision.¹⁰ However, it is unknown how many of these requests were fulfilled, how many were received, or how many were actually taken. Thus, we are unable to estimate how many pregnant people self-managed their abortions versus carried to term. Notably, totals of pills requested, while a critical signal of interest in abortion, are not the same as the number of abortions that occurred and should not be combined with the total number of abortions reported via #WeCount.

Second, our findings are all reported at the level of the state, so we cannot describe how individual clinics experienced increases or decreases within a single state. Observing the raw data, it is clear that the trends we report at the state level are not universally experienced by each clinic; put plainly, within a state, one clinic may be experiencing decreases in abortions while a neighboring clinic may be experiencing large increases. Similarly, we imputed, or estimated, a large proportion of abortions in Florida, New Jersey, New York, Washington DC, and Virginia. While we corroborated our numbers with Department of Health data for Florida, our abortion counts are more uncertain in the states that have greater levels of imputation. Finally, we did not account for seasonality-related changes in abortion volume, which has historically meant a decline in autumn months and an increase in the spring.¹ Thus, it is imperative to reflect on month-to-month shifts and continue to collect and report on these data throughout 2023.

Public health implications

The greatest declines in the numbers of abortion occurred in the same states with the greatest structural and social inequities in terms of maternal morbidity and mortality and poverty.¹¹ Thus, the impact of the *Dobbs* decision is not equally distributed. People of color and people working to make ends meet have been impacted the most. Additionally, three-quarters of abortion patients in the US live on low incomes, and 49% live under the Federal Poverty Level.¹² This inequity is corroborated by other studies, including one finding that after *Dobbs*, Black, Indigenous, and other people of color experienced the greatest increases in travel time to abortion facilities.¹³

Distance to care is also one of the biggest barriers, and prior research suggests that even an increase of 100 miles to abortion care can lead to increased birth rates.^{14,15} Those unable to overcome travel barriers are likely those with the fewest socioeconomic resources; even small declines in the abortion rate still translate into enormous life impacts for those affected. Highly vulnerable groups who are often unable to travel include: young people, incarcerated people, people on parole with travel limitations, and immigrants. Additionally, people who care for small children or the elderly and those who cannot take time off of work may find it impossible to travel out of state for abortion care. The COVID-19 pandemic and the current economy put people in an even more precarious financial situation, further limiting the number of people who have the money to pay for a substantial unexpected healthcare expense.

Substantial research has documented grave consequences of not being able to obtain a wanted abortion that persist for years. Compared to people who receive desired abortions, those who seek but are unable to obtain a desired abortion experience a variety of negative outcomes, including increased economic insecurity,^{16,17} poorer physical health,^{18,19} and continued exposure to violence from the man involved in the pregnancy.²⁰ Thus, we must resolve to keep our attention on the impacts of *Dobbs* on the thousands of people who were unable to obtain abortions in the first 12 months after the decision, as well as those who will certainly be impacted in the future.

Table 3, continued. Estimated change in the number of abortions per month post-Dobbs compared to pre-Dobbs months (April and May 2022), by state

Numbers have been corrected as needed for missingness with imputation. For states marked * there is less than 1% imputation, \dagger 1-4% imputation, \ddagger 5-14% imputation, § 15-29% imputation, \parallel 30-44% imputation, \parallel >45% imputation. States with no notation by their name have no imputation for missingness.
